SOIL SAMPLER'S ARE THE HEROES OF MINERAL EXPLORATION

At the forefront of grassroots exploration is soil sampling. Conducting soil sample collection across a regional grid, or designated line, provides a broad overview of the geochemistry of a property, and subsequently focuses future work and efforts where certain elemental anomalies, i.e. locations of a future mine, exist. These results are instrumental into driving project generation, and a lot of large producing mines would not exist today if it wasn't for a soil sampler's hard work. At Trailbreaker we are grateful for our amazing group of soil samplers! Our project and portfolio growth is in a large part indebted to our soil sampling crew's hard work, here's to all of you!"

- Daithi Mac Gearailt, President, CEO and Director
